Since the compounds according to the invention have at least two optically active carbon atoms, they can therefore be present in the form of stereoisomers, stereoisomer mixtures and in the form of the (essentially) pure diastereomers. Corresponding stereoisomers are likewise encompassed by the present invention.

Preferred compounds of the formula I are those in which the C atom to which the group $-X_1-R_2$ is bonded (essentially) has the R configuration and the C atom to which the group $-N(R_3)(R_4)$ is bonded (essentially) has the S configuration according to Cahn-Ingold-Prelog.

The compounds of the formula I have basic or, if R_3 and/or R_4 is carboxyl or substituted by carboxyl, amphoteric character and can therefore form acid addition salts and, if desired, internal salts.

Acid addition salts of compounds of the formula I are, for example, pharmaceutically acceptable salts thereof with suitable mineral acids, such as halohydric acids, sulfuric acid or phosphoric acid, e.g. hydrochlorides, hydrobromides, sulfates, hydrogensulfates or phosphates, or salts with suitable aliphatic or aromatic sulfonic acids or N-substituted sulfamic acids, e.g. methanesulfonates, benzenesulfonates, p-toluenesulfonates or N-cyclohexylsulfamates (cyclamates).

Pharmaceutically unsuitable salts can also be used for isolation or purification. Only the pharmaceutically acceptable, non-toxic salts are suitable for therapeutic use, and are therefore preferred.

The compounds prepared according to the invention including the compound $(2R^*,4S^*)$ -N-[1-(3,5-bistrifluoromethylbenzoyl)-2-(4-nitrobenzyl)piperidin-4-yl]acetamide have useful pharmacological properties. In particular, they show a pronounced antagonistic action against substance P and have the typical property spectrum for substance P antagonists. The binding of 3H -substance P to the bovine retina in the radioreceptor assay according to H. Bittiger, Ciba Foundation Symposium 91, 196-199 (1982) is thus inhibited in vitro at concentrations from approximately 0.01 $\mu\text{mol/l}$ by the compounds of the formula I and their pharmaceutically acceptable salts. The following in vitro values were thus

- 9 -

determined, for example, for the target compounds of Examples 2, 16 (2nd compound), 28 and 45 (c) and (f): 10nM - 11nM - 11nM - 7.6nM - 9nM.

Substance P is a naturally occurring undecapeptide of the tachykinin family. It is produced and deposited in sensory neurones of the spinal chord and of the brain of mammals and acts pharmacologically as a neurotransmitter and/or neuromodulator. The substance P antagonists of the formula I prepared according to the invention and their pharmaceutically acceptable salts are metabolically stable and are therefore eminently suitable for the prophylactic and therapeutic treatment of disorders in which substance P plays an important part, for example in attacks of pain, in migraine, in disorders of the central nervous system, such as anxiety states, schizophrenia and depression, in certain motor disorders, such as Parkinson's disease, in inflammatory disorders, such as rheumatoid arthritis and osteoarthritis, in disorders of the respiratory organs, such as asthma, chronic bronchitis and chronic rhinitis, in disorders of the gastrointestinal system, such as ulcerative colitis and Crohn's disease, in emesis, in particular chemically induced emesis, and in hypertension. Furthermore, the compounds according to the invention may be used for the inhibition of angiogenesis and may protect against sun burn.

The substance P antagonists of the formula I prepared according to the invention and their pharmaceutically acceptable salts, including the compound (2R*,4S*)-N-[1-(3,5-bis-trifluoromethylbenzoyl)-2-(4-nitrobenzyl)piperidin-4-yl]acetamide, accordingly are eminently suitable for the therapeutic treatment of the disorders mentioned. The industrial production of the active substances is also included in the production of the medicaments.

The invention relates primarily to compounds of the formula I, in which
R₁ is a benzoyl, naphthoyl or cycloalkanoyl radical which is unsubstituted or substituted by lower alkyl, lower alkoxy, halogen and/or trifluoromethyl,
R₂ is 3- to 8-membered cycloalkyl or a phenyl or naphthyl radical which is unsubstituted or substituted by lower alkyl, lower alkoxy, halogen, nitro, cyano and/or trifluoromethyl.

The reactions according to the process and the preparation of novel starting substances or intermediates are carried out in analogy to the manner of reaction and formation of known starting substances or intermediates. Even if not expressly mentioned below, the auxiliaries customary in each case, such as catalysts, condensing and solvolysis agents and/or solvents or diluents, and reaction conditions, such as temperature and pressure conditions, and also, if desired, protective gases are used here.

Salts of starting materials which have at least one basic centre, for example of the formulae II or VI, are corresponding acid addition salts, while salts of starting substances which have an acidic group are present as salts with bases, in each case as mentioned above in connection with corresponding salts of the formula I.

The reactions described hereinbefore and hereinafter in the variants are carried out in a manner known per se, e.g. in the absence or, customarily, in the presence of a suitable solvent or diluent or of a mixture thereof, the reaction being carried out, if required, with cooling, at room temperature or with heating, e.g. in a temperature range from approximately -80°C up to the boiling point of the reaction medium, preferably from approximately -10° to approximately $+200^{\circ}\text{C}$, and, if necessary, in a closed vessel, under pressure, in an inert gas atmosphere and/or under anhydrous conditions.

The introduction of the radical R_1 by reaction with an agent introducing the radical R_1 , according to process variant a) is carried out in a customary manner, for example by reaction with an N-acylating agent of the formula R_1-Y_a (IIA), in which R_1 has one of the definitions given at the beginning and Y_a is free or etherified hydroxyl, such as hydroxyl,

- 20 -

lower alkoxy or unsubstituted or substituted phenoxy, or reactive esterified hydroxyl, such as halogen, in particular chlorine, or a radical of the formula $-O-R_1$.

If necessary, the reaction is carried out with thermal decomposition of intermediately formed ammonium salts or in the presence of a condensing agent, such as a dehydrating agent, or basic condensing agents, and in the presence of a solvent or diluent. Customary condensing agents are, for example, carbodiimides, such as diethyl-, dipropyl-, N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide or, in particular, dicyclohexylcarbodiimide, and also suitable carbonyl compounds, for example carbonyldiimidazole, 1,2-oxazolium compounds, e.g. 2-ethyl-5-phenyl-1,2-oxazolium-3'-sulphonate and 2-tert-butyl-5-methylisoxazolium perchlorate, or a suitable acylamino compound, e.g. 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline, and also activated phosphoric acid derivatives, e.g. diphenylphosphoryl azide, diethylphosphoryl cyanide, phenyl N-phenylphosphoramidochloridate, bis(2-oxo-3-oxazolidinyl)phosphinoyl chloride or 1-benzotriazolyloxytris(dimethylamino)phosphonium hexafluorophosphate. The reaction is thus performed using acids (IIA1; $Y = COOH$) preferably in the presence of a dehydrating agent, such as of N,N-dicyclohexylcarbodiimide or with thermal decomposition of the ammonium salt primarily formed, while the reaction with acid anhydrides (IIA1; $Y = \text{halogen or } -O-(C=O)-R_1$) is preferably carried out in the presence of a basic condensing agent, such as of an alkali metal hydroxide or carbonate, e.g. potassium carbonate, or of a tertiary or sterically hindered secondary organic amine, such as of a tri-lower alkylamine, e.g. of triethylamine or diisopropylamine, or of an aromatic nitrogen base, e.g. of pyridine.

The starting substances of the formula II can be prepared in a customary manner, preferably by introducing the radical R_3 and, if desired, R_4 into a 2-(R_2-X_1)-aminopiperidine intermediately protected in position 1 by an amino protective group, e.g. by tertiary butoxycarbonyl, and removing the amino protective group in a customary manner, for example by treating with trifluoroacetic acid. If R_4 is hydrogen, the corresponding starting compound of the formula II protected by trifluoroacetyl on the exocyclic N atom is obtained in this case. The introduction of the radical R_3 and, if desired, R_4 , is in this case preferably carried out as described hereinafter under process variant b).

Starting substances of the formula II in which R_3 is a group of the formula $-(CH_2)_n-(C=O)-R_5$ (Ia) in which n is 0 and R_5 is unsubstituted lower alkyl or lower alkyl which is substituted by

halogen, lower alkoxy or unsubstituted amino or amino which is substituted by lower alkyl, lower alkanoyl, lower alkoxycarbonyl or lower alkylene or aza-, oxa- or thia-lower alkylene, and R_4 is hydrogen or lower alkyl, can preferably be prepared by treating a lower alkyl N-[1-(X_1 - R_2)but-3-enyl]carbamate with sodium hydride, for example in boiling tetrahydrofuran, and then reacting with a chloromethyl lower alkyl ether, reacting the N-lower alkoxyethyl-N-[1-(X_1 - R_2)but-3-enyl]carbamate obtained with a corresponding nitrile of the formula R_5 -CN and chlorosulfonic acid with cooling and removing the esterified 1-carboxylic acid group from the 2-(X_1 - R_2)-4-(R_5 CO)-piperidine-1-carboxylic acid ester obtained, e.g. by treatment with hydrogen bromide in acetic acid.

In starting substances of the formula III or IV according to process variant b), reactive esterified hydroxyl is, for example, a halogen atom, such as chlorine, bromine or iodine, or, if R_3 has a saturated C atom in the α -position, e.g. if n is 1, a sulphonyloxy group, e.g. methanesulphonyloxy or p-toluenesulphonyloxy, or if R_3 has a carbonyl group in the α -position, e.g. n is 1, a group of the formula $-O-(C=O)-R_5$. Etherified hydroxyl is, for example, lower alkoxy, such as methoxy or ethoxy, or substituted or unsubstituted phenoxy.

The compounds of the formulae III and IV are reacted in a customary manner, for example with thermal decomposition of intermediately formed ammonium salts or in the presence of a condensing agent, such as of a dehydrating agent, e.g. of N,N-dicyclohexylcarbodiimide or of bis(2-oxo-3-oxazolidinyl)phosphinoyl chloride, or of a basic condensing agent, preferably of pyridine or of a tri-lower alkylamine, e.g. of triethylamine, or of an alkali metal carbonate or hydrogencarbonate, if necessary in the presence of a solvent or diluent.

The reaction is thus performed using acids of the formula IV ($Y_2 = OH$), preferably in the presence of bis(2-oxo-3-oxazolidinyl)phosphinoyl chloride and of a tri-lower alkylamine, for example in a halohydrocarbon, such as dichloromethane, or a cyclic aliphatic ether, such as tetrahydrofuran or dioxane.

The reaction with reactive esters of the formula IV or III (Y_2 or $Y_1 =$ reactive esterified hydroxyl) or with acid anhydrides of the formula IV ($Y_2 =$ hydroxyl which is converted into an anhydride) is carried out, in particular, in the presence of a basic condensing agent, such as a heterocyclic base, e.g. pyridine, 4-dimethylaminopyridine or preferably N-methyl-

morpholine, or of a tri-lower alkylamine, e.g. of triethylamine or diisopropylamine, for example in a halohydrocarbon, such as dichloromethane, or a cyclic aliphatic ether, such as tetrahydrofuran or dioxane, or of an aliphatic nitrile, e.g. in acetonitrile. If a primary amine of the formula III ($Y_1 = NH_2$) is reacted with a β -branched lower alkyl halide of the formula IV ($Y_2 = \text{halogen}$; $R_3 = \text{lower alkyl}$) in the presence of an alkali metal carbonate or hydrogencarbonate, the incorporation of carbon dioxide can occur. In addition to or instead of the target compound of the formula I in which R_3 is lower alkyl, the corresponding compound of the formula I which is N-substituted by the group $-(C=O)-O-R_3$ is then obtained.

Starting substances of the formula III in which Y_1 is primary amino are obtained, for example, by treating an appropriate 4-amino-2-(X_1-R_2)-piperidine or its trifluoroacetate with trifluoroacetic anhydride, condensing the resulting N-[2-(X_1-R_2)piperidin-4-yl]trifluoroacetamide with an N-acylating agent of the formula R_1-Y_a (IIA), in which R_1 has one of the definitions given at the beginning and Y_a is free, etherified or reactive esterified hydroxyl, for example as indicated under process variant a), and treating the resulting N-[1- R_1 -2-(X_1-R_2)piperidin-4-yl]trifluoroacetamide with strong, e.g. approximately 5-normal, sodium hydroxide solution.

Starting substances of the formula III, in which Y_1 is hydroxyl are obtained, for example, by reacting an appropriate 1-(R_2-X_1)-1-(R_1 -amino)but-3-ene with a halomethyl-lower alkyl ether in the presence of benzyltrimethylammonium bromide, treating the resulting 1-(R_2-X_1)-1-(N- R_1 -N-lower alkoxyethylamino)but-3-ene with an excess of formic acid and hydrolysing the resulting 1- R_1 -2-(X_1-R_2)piperidin-4-yl formate with strong hydrochloric acid to give the corresponding 1- R_1 -2-(X_1-R_2)piperidin-4-ol of the formula III ($Y_1 = \text{hydroxyl}$). Compounds of the formula III in which Y_1 is reactive esterified hydroxyl can be prepared from these by reaction with an agent introducing a reactive esterified hydroxyl group, such as a sulfonyl halide, e.g. with methanesulfonyl chloride, or a halogenating agent, such as thionyl chloride, preferably in the presence of pyridine.

The amino protective group Y_3 according to process variant c) is, for example, a free or halogenated lower alkanoyl group, such as trifluoroacetyl, or an acyl group derived from a hemiester of carbonic acid, such as a lower alkoxyacetyl or α -phenyl-lower

alkoxycarbonyl group, e.g. tertiary butoxycarbonyl or benzyloxycarbonyl, or a silyl group, such as tri-lower alkylsilyl, e.g. trimethylsilyl. The amino protective group is removed in a customary manner, for example by acid treatment, or starting from compounds V, in which Y_3 is halogenated lower alkyl, such as trifluoroacetyl, by reductive elimination, for example by treating with a di-light metal hydride, such as sodium borohydride, preferably in a lower alkanol, such as methanol.

The starting substances of the formula V can be prepared, for example, in analogy to process variant a), starting from appropriate $N-Y_3-N-[2-(X_1-R_2)\text{piperidin-4-yl}]$ amines.

The reaction of compounds of the formula VI with aldehydes of the formula VII according to process variant d) is carried out, for example, in the presence of water and of a hydrogenation catalyst, such as of a platinum or palladium catalyst or of Raney nickel, or in the presence of a di-light metal hydride, such as sodium borohydride or sodium cyanoborohydride, preferably in a solvent which is inert under the reaction conditions, such as of a lower alkanol, such as methanol or ethanol, or of a di-lower alkyl or lower alkylene ether, such as diethyl ether, dioxane or tetrahydrofuran.

In a reactive diester of a lower alkane diol or aza-, oxa- or thia-lower alkanediol according to process variant e), reactive esterified hydroxyl is, for example, a halogen atom, such as chlorine, bromine or iodine, or a sulphonyloxy group, e.g. methanesulfonyloxy or p-toluenesulfonyloxy. The condensation is preferably carried out in the presence of a basic condensing agent, such as of a metal base, e.g. of an alkali metal carbonate, if necessary with heating, e.g. in the temperature range from approximately 60° to approximately 140°C, if desired at elevated pressure.

In starting substances of the formulae IX and X according to process variant f), carboxyl Y_4 or Y_5 which is free, converted into an anhydride or esterified is, for example, halocarbonyl or, in the case of Y_5 a group of the formula $R_2-C(=O)-O-$ and a metallic radical Y_4 or Y_5 is, for example, an alkali metal atom or a group of the formula $-M^{II}/2$ or $M^{II}-hal$, in which M^{II} is a metal atom of group IIb of the Periodic Table of the Elements, such as Mg or Zn.

The condensation of compounds of the formulae IX and X is carried out in a customary manner, for example in an ethereal solvent, such as an aliphatic or cycloaliphatic ether, e.g. in diethyl ether, methoxybutane, dibutyl ether, tetrahydrofuran or dioxane.

Starting substances of the formula IX in which Y_4 is formyl or carboxyl which is free, converted into an anhydride or esterified, are prepared, for example, in an analogous manner, such as described under process variants a) and b), starting from appropriate starting substances which have a radical Y_4 instead of the group $-X_1-R_2$.

Compounds obtainable according to the process can be converted into other compounds of the formula I in a customary manner.

The carboxyl group can thus be esterified in a customary manner in compounds of the formula I in which the radical R_3 contains carboxyl. The free or esterified carboxyl group can also be amidated in compounds of the formula I in which R_3 contains free or esterified carboxyl. Conversely, the esterified or amidated carboxyl group can be hydrolysed to carboxyl in compounds of the formula I in which R_3 contains esterified or amidated carboxyl.

Compounds of the formula I in which X_1 is carbonyl can also be reduced in a customary manner to the corresponding compounds of the formula I in which X_1 is hydroxymethylene, for example as described under process variant f). In an analogous manner, resulting compounds of the formula I in which X_1 is hydroxymethylene can also be reduced to the corresponding compounds of the formula I in which X_1 is methylene.

In resulting compounds of the formula I in which X_1 is ketalized carbonyl, the carbonyl group can be liberated in a customary manner, for example by acid treatment. Conversely, carbonyl X_1 can be ketalized by reaction with an appropriate alcohol, such as a lower alkanol or a lower alkanediol.

In resulting compounds of the formula I in which R_4 is hydrogen, a radical R_4 which is other than hydrogen can also be introduced, lower alkyl, for example, by customary alkylation and, if desired as indicated, substituted alkanoyl by customary acylation. Conversely, in resulting compounds of the formula I in which R_4 is lower alkyl, in particular methyl, the lower alkyl group can be removed by treatment with a haloformic acid ester, such as methyl haloformate.

Likewise, in resulting compounds of the formula I in which R_4 is trifluoroacetyl, the trifluoroacetyl group can be removed in a customary manner, in particular by treating with a di-light metal hydride, for example with sodium borohydride in a lower alkanol, such as methanol.

Resulting salts can be converted into the free compounds in a manner known per se, e.g. by treating with a base, such as an alkali metal hydroxide, a metal carbonate or hydrogencarbonate, or another salt-forming base mentioned at the beginning, or with an acid, such as a mineral acid, e.g. with hydrochloric acid, or another salt-forming acid mentioned at the beginning.

Resulting salts can be converted into other salts in a manner known per se, acid addition salts, for example, by treating with a suitable metal salt, such as a sodium, barium or silver salt, of another acid in a suitable solvent in which an inorganic salt formed is insoluble and thus precipitates from the reaction equilibrium, and base salts by liberation of the free acid and fresh salt formation.

The compounds of the formula I, including their salts, can also be obtained in the form of hydrates or include the solvent used for crystallization.

As a result of the close relationship between the novel compounds in free form and in the form of their salts, hereinbefore and hereinafter the free compounds and their salts are analogously and expediently to be understood as also meaning, where appropriate, the corresponding salts or free compounds.

Resulting diastereomer mixtures and racemate mixtures can be separated into the pure diastereomers or racemates in a known manner on the basis of the physicochemical differences of the constituents, for example by chromatography and/or fractional crystallization.

Resulting racemates can also be resolved into the optical antipodes by known methods, for example by recrystallization from an optically active solvent, with the aid of microorganisms or by reaction of the resulting diastereomer mixture or racemate with an optically active auxiliary compound, e.g. corresponding to the acidic, basic or functionally modifiable groups

contained in compounds of the formula I, with an optically active acid, base or an optically active alcohol, into mixtures of diastereomeric salts or functional derivatives, such as esters and separation thereof into the diastereomers, from which the enantiomers desired in each case can be set free in the manner customary in each case. Bases, acids and alcohols suitable for this purpose, are, for example, optically active alkaloid bases, such as strychnine, cinchonine or brucine, or D- or L-(1-phenyl)ethylamine, 3-pipecoline, ephedrine, amphetamine and similar synthetically accessible bases, optically active carboxylic or sulfonic acids, such as quinic acid or D- or L-tartaric acid, D- or L-di-o-toluytartaric acid, D- or L-malic acid, D- or L-mandelic acid, or D- or L-camphorsulfonic acid, or optically active alcohols, such as borneol or D- or L-(1-phenyl)ethanol.

The invention also relates to those embodiments of the process according to which a compound obtainable from any stage of the process as an intermediate is used as a starting compound and the missing steps are carried out or a starting substance is used in the form of a salt or, in particular, formed under the reaction conditions.

The novel starting substances, which were especially developed for the preparation of the compounds according to the invention, in particular the choice of starting substance leading to the compounds of the formula I characterized as preferred at the beginning, the processes for their preparation and their use as intermediates also form a subject of the invention.

The invention likewise relates to pharmaceutical preparations which contain compounds according to the invention or pharmaceutically acceptable salts [including those of the compound (2R*,4S*)-N-[1-(3,5-bis(trifluoromethyl)benzoyl)-2-(4-nitrobenzyl)piperidin-4-yl]-acetamide] thereof as active ingredients, and processes for their preparation. The novel compounds of the formula I can be used, for example, in the form of pharmaceutical preparations which contain a therapeutically effective amount of the active substance, if appropriate together with inorganic or organic, solid or liquid, pharmaceutically acceptable excipients which are suitable for enteral, e.g. oral, or parenteral administration. Tablets or gelatin capsules are thus used which contain the active ingredient together with diluents, e.g. lactose, dextrose, sucrose mannitol, sorbitol, cellulose and/or lubricants, e.g. siliceous earth, talc, stearic acid or salts thereof, such as magnesium or calcium stearate, and/or polyethylene glycol. Tablets can likewise contain binders, e.g. magnesium aluminium

silicate, starches, such as maize, wheat, rice or arrowroot starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and/or polyvinylpyrrolidone, and, if desired, disintegrants, e.g. starches, agar, alginic acid or a salt thereof, e.g. sodium alginate, and/or effervescent mixtures, or absorbents, colourants, flavourings and sweeteners. The novel compounds of the formula I can also be used in the form of parenterally administerable preparations or of infusion solutions. Such solutions are preferably isotonic aqueous solutions or suspensions, it being possible to prepare these before use, for example in the case of lyophilized preparations which contain the active substance on its own or together with a carrier, e.g. mannitol. The pharmaceutical preparations can be sterilized and/or contain excipients, e.g. preservatives, stabilizers, wetting agents and/or emulsifiers, solubilizers, salts for regulating the osmotic pressure and/or buffers. The present pharmaceutical preparations, which, if desired, can contain other pharmacologically active substances, are prepared in a manner known per se, for example by means of conventional mixing, granulating, sugar-coating, dissolving or lyophilizing processes and contain from approximately 0.1% to 100%, in particular from approximately 1% to approximately 50%, and lyophilisates up to approximately 100%, of the active substance.

The invention likewise relates to the use of the compounds of the formula I including the compound (2R*,4S*)-N-[1-(3,5-bistrifluoromethylbenzoyl)-2-(4-nitrobenzyl)piperidin-4-yl]-acetamide, preferably in the form of pharmaceutical preparations. The dose can depend on various factors, such as the manner of administration, species, age and/or state of the individual. In the case of oral administration, the doses to be administered daily are between approximately 1 and approximately 50 mg/kg and, for warm-blooded animals having a body weight of approximately 70 kg, preferably between approximately 80 mg and approximately 250 mg.
